

## OUR TWO-SIDED POUCH

Dot® pouches are split into two sides: Side A contains an Oxidizer, and Side B contains our Activator. When these components are properly mixed, Dot's patented Dilute Oxidation Technology® is engaged, resulting in powerful cleaning.

## MIXING INSTRUCTIONS

### STEP 1

Pour contents of Side A (Oxidizer) into a large bucket with the volume of water stated on the front of the pouch. The use of hot water is preferred when mixing Dot products. Hot water can be attained from a kitchen sink, bathtub, or utility sink.

### STEP 2

Stir or agitate until powder is completely dissolved (1-2 minutes). Use a power drill with a paint mixer attachment for quick results. **Note:** If accessing water on site is an issue, the Oxidizer (Side A) can also be mixed in the shop prior to transport. The Activator (Side B) should then be added to the mixture immediately before beginning the job.

### STEP 3

Pour the contents of Part B (Activator) into the now mixed Side A solution.

### STEP 4

Stir until fully dissolved. Side B will generally dissolve completely with 2-3 good stirs.

### READY TO USE

Once combined, Dot delivers peak performance for about 2-3 hours. Stain removal continues until the surface is fully dry.

**STORING DOT:** Unopened pouches should be stored in a cool dry place.
